**New demand and Chinese costs to drive LME
Indian smelters set for turnaround**

Aluminium: New demand and Chinese costs to drive LME

Indian smelters set for turnaround; Hindalco our top pick

| | Page No. |
|--|--------------|
| Summary | 3-5 |
| <hr/> | |
| Aluminum: Youngest and fastest growing metal | 7-13 |
| Demand for aluminium fastest growing among metals | |
| Driver 1: Rising price competence | |
| Driver 2: Falling cost of production | |
| Driver 3: Newer applications | |
| <hr/> | |
| LME aluminium prices set to outperform | 14-28 |
| Smelting relocating closer to low cost energy sources | |
| Aluminium production shifting to Asia | |
| Middle East has attracted investments on low cost energy | |
| China has gained share on strong domestic demand | |
| India production has grown on strong domestic demand and low cost advantage | |
| Relocating smelting driving bauxite trade and prices | |
| Middle East - losing low cost energy advantage | |
| China - costs are moving up | |
| LME aluminium prices to move up | |
| China demand and smelters will drive cost curves steeper | |
| Unwinding of warehousing queues will put pressure on LME prices - a myth | |
| <hr/> | |
| Indian smelters getting competitive again | 29-33 |
| Indian smelters went up the cost curve | |
| Cost of production has started declining | |
| Power cost declining | |
| Labor cost pressure easing | |
| Other operating costs to moderate | |
| Indian aluminium: pricing power intact unlike steel | |
| <hr/> | |
| Hindalco: Our top pick | 34-35 |
| Sesa-Sterlite group less leveraged than Hindalco, but capital structure inefficient | |
| Nalco's balance sheet best, but it is high up on the cost curve | |
| <hr/> | |
| Companies | 36-60 |
| <hr/> | |
| Hindalco: At inflexion; operating cash flows to accelerate | 37 |
| <hr/> | |
| Sesa-Sterlite: Simpler group structure, but high capital inefficiencies | 48 |
| <hr/> | |
| NALCO: Rising CoP concerning, but multiple long term positives | 55 |

Aluminium

New demand and Chinese costs to drive LME

Indian smelters set for turnaround; Hindalco our top pick

- **Rising price competence driving demand:** Although aluminum has underperformed at LME, its demand growth has been outperforming other base metals and steel. Aluminum being the youngest metal with only 100 years of history is still witnessing improvement in operating efficiencies and reduction in cost of production. Aluminum has been continuously finding new applications due to rising price competence, superior weight to strength ratio, corrosion resistance, formability, dampness etc. Stricter emission norms are now forcing large cars to switch fully to aluminum leading to demand boost. Once the ecosystem of ancillary is developed, aluminum is bound to replace steel in mass produced cars. FRP demand in auto sector is growing at 25% CAGR. We expect the accelerated growth to last for decades.
- **Aluminum set for outperformance at LME:** China now accounts for 44% of metal production, while it produces only 20% of world's bauxite. With its metal consumption far from peak, China's dependence on bauxite imports is likely to grow to 70% over 5-10 years. China is highly vulnerable due to over dependence on Indonesian bauxite. As China started scouting for alternate supplies, the prices of bauxite and alumina have been outperforming LME. Notwithstanding oversupply, we expect aluminum prices to outperform other base metals due to rising cost of production in half of the world and choking of investment in other part of world.
- **Indian smelter set for outperformance:** We believe that India's aluminum sector is now set for a turnaround. Cost of production has peaked. Profitability should increase, aided by sharp depreciation of INR against USD, easing prices of inputs like coal and CPC, likely increase in LME prices and end of the capex cycle, leading to improved cash flows.
- **Hindalco is our top pick; Nalco too upgraded to Buy:** Hindalco is at an inflexion point. Operating cash flows are poised for rapid growth, as the benefits of USD8b investment have begun. Margins of the aluminum business should expand, driven by declining cost of production. Hindalco has near full bauxite and partial coal security through captive mines. Its balance sheet is highly geared, but it has the best cash flow hedge among Indian metal companies. Novelis' free cash flows to improve in FY15 as it exits CapEx cycle. We value Hindalco at INR 165 based on SOTP (42% upside). Re-iterate **Buy**.
- Nalco is long on alumina, with 60-70% of production available for third-party sale. Though metal production has declined due to difficulty in sourcing additional coal, alumina production is rising due to the benefit of captive bauxite and recent capacity expansion. Potential upsides from Utkal-E block, further expansion of alumina refinery, weaker INR v/s USD, and peaking of labor cost as older employees retire are long-term positives. Nalco's SOTP-based target price is revised to INR52 (62% upside). We upgrade Nalco to Buy.
- Although, Sesa-Sterlite has high quality assets, it has got de-rated and is unlikely to get re-rated until capital inefficiencies are addressed. We maintain Buy, as SOTP-based valuations are still attractive.

Aluminum: Youngest and fastest growing metal

Demand for aluminum is growing faster than steel, copper and zinc. Over last fifty years, global demand for aluminium has grown at a CAGR of 4.5% (elasticity of 1.3x with GDP growth) as against a CAGR of 2.6-2.9% (elasticity of 0.7x with GDP growth) for other metals. Aluminum is the youngest metal, with only ~100 years of commercial history. Its cost of production has been continuously declining with technological advancements, and it is finding new applications as its price competence improves.

Aluminum price is now 3.4x steel price v/s 5x 20 years ago, lower than zinc price v/s 1.2x 20 years ago, and 1/4th copper price v/s 3/5th 20 years ago. Rising price competence has helped aluminum eat into demand for steel (construction, transportation, etc), zinc (coating, etc) and copper (electricity transmission, etc). With rising oil prices and growing pollution, there is an urgent need for light weighting vehicles, opening the door for acceleration in demand for aluminum over the next 10-20 years. Europe plans to cut vehicular emission 30% by 2020. USA and many other countries too have set new targets.

It makes tremendous economic sense in light weighting vehicles using aluminum as 100kg (USD160/ton of extra metal cost), which is 10% of smaller car's weight, reduction in weight save 700 liters of petrol or ~USD700 over the life of a vehicle. Demand for aluminum is more resilient than steel despite economic volatility. We believe that aluminum demand will continue to outperform, with a CAGR of 4-5% over the next 5-20 years.

LME aluminum prices set to outperform

Aluminum production has been continuously relocating closer to sources of energy and bauxite to lower cost of production. US, USSR and Japan, which once produced 60% of the world's aluminum, now hardly account for 10%. In the last decade, 102% of the growth in production came from Asia. China accounted for 80% of this growth, while India and the Middle East (ME) accounted for the rest. There was an investment in capacity addition of 5m tons in the ME and ~3m tons in India in the last 5-8 years.

China now accounts for 44% of the world's metal and alumina production, while it produces only 20% of the world's bauxite. China's dependence on bauxite imports, which is nearly 50% now, is likely to grow further to 70% over the next 5-10 years. Since 2/3rd of the world's bauxite is located in just three countries, prices of bauxite are likely to increase. Alumina prices have been continuously outperforming LME. No new investment is expected in the ME and India over the next 5-10 years. The ME is no longer offering cheap gas because over-investment in LNG infrastructure has brought gas closer to energy deficit markets of India, Korea and Japan. Price of USD4-5/mmbtu (more than 5% of coal prices in USD/ton) makes natural gas uneconomical for power generation. India has over-invested in aluminum capacity. Cost of Chinese aluminum are increasing due to CNY appreciation, higher cost of bauxite and rising labor cost.

Under tremendous cost pressure, China is trying to relocate some capacities closer to the coal belt, but this is resulting in greater distance for transport of bauxite and high labor cost due to extreme climatic conditions. Once new capacities become

operational, low energy cost advantage too is likely to be eroded partially. Fears over compression in spot premiums are irrelevant because total aluminum prices (LME + premiums) matter to both producers and users. Notwithstanding oversupply, the young metal is set for outperformance over the next 5-10 years on the back of stronger demand fundamentals, changing dynamics of alumina/bauxite pricing and appreciating CNY.

Indian smelters set for turnaround

India is endowed with large resources of coal (3rd largest in the world), bauxite (5th largest in the world) and labor pool (2nd largest in the world) - the key ingredients in aluminum production, and bauxite and coal mining. This gives India a natural advantage, making it one of the lowest cost producers in the world, with cost of production below USD1,000/ton a decade ago.

The competitiveness of Indian smelters had eroded rapidly in the last five years due to change in the dynamics of coal pricing by Coal India, other input cost pressures and high inflation. However, this did not deter Sesa-Sterlite and Hindalco from investing USD8b and USD6b, respectively, in the last 4-5 years. Falling ROI and huge capex burden led to huge stock underperformance.

We believe that India's aluminum sector is now set for a turnaround. Cost of production has peaked. Profitability should increase, aided by sharp depreciation of INR against USD, easing prices of inputs like coal and CPC, likely increase in LME prices and end of the capex cycle, leading to improved cash flows.

Hindalco: Our top pick

Hindalco is at an inflexion point. Operating cash flows are poised for rapid growth, as the benefits of USD8b investment have begun. Margins of the aluminum business should expand, driven by declining cost of production. Hindalco has near full bauxite and partial coal security through captive mines. Its balance sheet is highly geared, but it has the best cash flow hedge among Indian metal companies. Its debt maturity profile is very comfortable and back-ended. Free cash flows are turning positive, along with rising operating cash flows and tapering capex. The stock trades at historical trough valuations.

Sesa-Sterlite group less leveraged than Hindalco, but capital structure inefficient:

Though Sesa-Sterlite is less leveraged at the group level than Hindalco, its capital structure is highly inefficient. Another group restructuring is inevitable once the Government of India divests its stake in Hindustan Zinc. We fear that the management may not choose the most efficient capital structure because that conflicts with its strategy of aggressive inorganic growth. Minority interest in cash-rich subsidiaries is a useful strategic leverage at the time of acquisition. Although, Sesa-Sterlite has high quality assets, it has got de-rated and is unlikely to get re-rated until capital inefficiencies are addressed and minority interest in cash-rich subsidiaries is bought out through M&A. We maintain Buy, as SOTP-based valuations are still attractive.

Nalco's balance sheet best, but it is high up on the cost curve: Nalco has the best balance sheet, with no debt and cash surplus of ~INR50b. Falling labor productivity

due to declining capacity utilization of smelter and 2-3x higher annual labor wages as compared to peers has moved it up on the cost curve, despite the benefit of captive bauxite and proximity to Coal India's mines. Nalco is long on alumina, with 60-70% of production available for third-party sale. Though metal production has declined due to difficulty in sourcing additional coal, alumina production is rising due to the benefit of captive bauxite and recent capacity expansion. Potential upsides from Utkal-E block, further expansion of alumina refinery, weaker INR v/s USD, and peaking of labor cost as older employees retire are long-term positives. In view of the changed business dynamics and recent turn in operating performance, we believe that the stock deserves a higher EV/EBITDA target multiple of 5.5x (earlier 4x). Topping it with the value of CWIP, our SOTP-based target price is revised to INR52. We upgrade the stock to **Buy**.

Aluminum: Youngest and fastest growing metal

Declining cost of production, newer applications driving demand

- Demand for aluminum is growing faster than steel, copper and zinc. Over last fifty years, global demand for aluminum has grown at a CAGR of 4.5% (elasticity of 1.3x with GDP growth) as against a CAGR of 2.6-2.9% (elasticity of 0.7x with GDP growth) for other metals. Aluminum is the youngest metal, with only ~100 years of commercial history. Its cost of production has been continuously declining with technological advancements, and it is finding new applications as its price competence improves.
- Aluminum price is now 3.4x steel price v/s 5x 20 years ago, lower than zinc price v/s 1.2x 20 years ago, and 1/4th copper price v/s 3/5th 20 years ago. Rising price competence has helped aluminum eat into demand for steel (construction, transportation, etc), zinc (coating, etc) and copper (electricity transmission, etc). With rising oil prices and growing pollution, there is an urgent need for light weighting vehicles, opening the door for acceleration in demand for aluminum over the next 10-20 years. Europe plans to cut vehicular emission 30% by 2020. USA and many other countries too have set new targets.
- It makes tremendous economic sense in light weighting vehicles using aluminum as 100kg, (USD160/ton of extra metal cost) which is 10% of smaller car's weight, reduction in weight save 700 liters of petrol or ~USD700 over the life of vehicle. Demand for aluminum is more resilient than steel despite economic volatility. We believe that aluminum demand will continue to outperform, with a CAGR of 4-5% over the next 5-20 years.

Demand for aluminum fastest growing among metals

Over the last 50 years, demand for aluminum has been growing at the fastest pace among metals. Global primary aluminum production has grown at a CAGR of 4.5% over 1962-2012, while the production of crude steel, copper and zinc has grown at a CAGR of 2.9%, 2.8% and 2.6%, respectively against GDP growth of 3.4%. Aluminum production growth has accelerated to 5.6% in the recent 10 years, ~2x the global GDP CAGR. Elasticity of demand with GDP growth has averaged 1.3x for aluminum v/s 0.7x for steel, copper and zinc in the last 50 years.

Global metals' production and GDP indexed to 100 at 1962

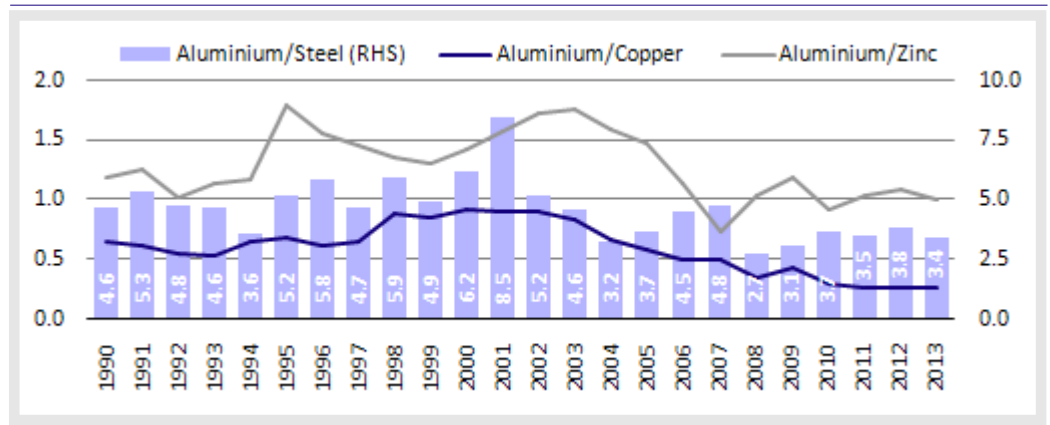

Source: USGS, WB, MOSL

Driver 1: Rising price competence

About 8.2% of the earth's crust is composed of aluminum. Though it is the most abundant metal, it is never found free state in nature. All of the earth's aluminum is combined with other elements to form compounds. It was first produced in 1825 but the first commercial production started in 1854. The price of the metal dropped from USD1.2m/ton in 1852 to USD40,000/ton in 1859, but it remained too expensive to be widely used. Then on 2 April 1889, Charles Martin Hall patented an inexpensive method for the production of aluminum, which brought the metal into wide commercial use. Alcoa was the first company to produce at commercial scale. By 1914, aluminum prices had fallen to USD400/ton, which spurred demand for the light metal. Until 1930, only ~300k tons of aluminum were used. Ever since, global consumption of aluminum has increased 150x and it is still very young. Per capita global average consumption of aluminum is only ~8kg v/s ~200kg for steel.

Aluminum prices with respect to other substitute metals

Source: IMF, MOSL

The prices of aluminum have continued to fall with respect to other metals because of technological advancement, which has continuously reduced its cost of production. Aluminum has been competing with steel, copper, zinc, plastics, etc. Aluminum prices used to be ~5x steel prices 20 years ago. Now, aluminum prices are only 3.4x steel prices. Aluminum has found wide use in building/construction due to its superior surface properties, corrosion resistance, formability, and superior weight-to-strength ratio. For same stiffness, aluminum structures are 40-55% lighter than steel, while maintenance costs are much lower. Further, the salvage value of aluminum is much higher than steel because of lower cost of conversion from scrap to metal and lower corrosion loss. Re-cycling cost are much lower than steel for same applications. Aluminum has slowly and gradually been making more roads every year into construction, machinery and auto industries. Weaker prices will drive aluminum demand further.

Aluminum used to trade at 35% discount to copper prices in 1990. The premium that copper commanded was in line with its superior electrical conductivity, thermal conductivity and ductility. Now, aluminum trades at ~74% discount to copper. This has spurred substitution. The trend is likely to continue because the aluminum market is oversupplied, while the copper concentrate market remains tight.

Aluminum prices and supply/demand

Aluminum has largely been oversupplied

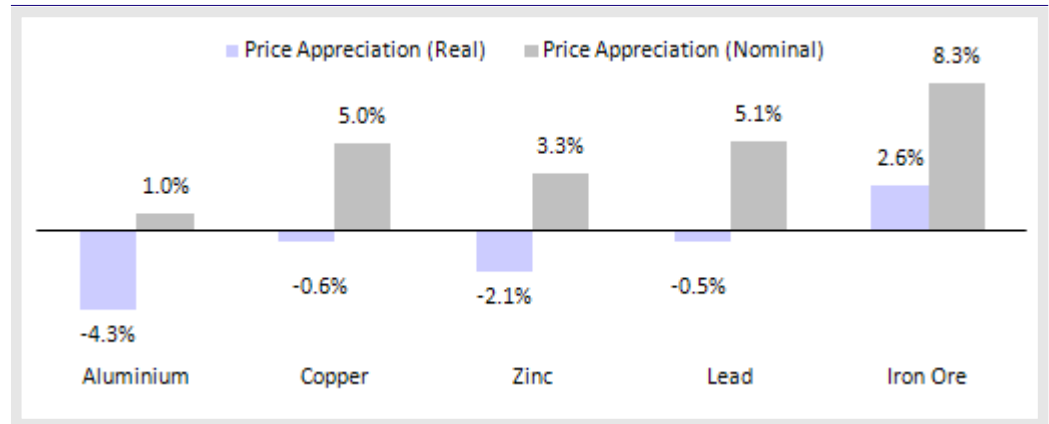

*Surplus/Deficit on 12 months average basis

Source: Bloomberg, MOSL

Aluminum has been substituting zinc as well in coatings. In the last 10-20 years, products like "Galvalume" have substituted zinc galvanized sheets due to superior quality and lower costs. Aluminum used to be 20% more expensive in 1990 and 75% more expensive in 1995. Now, aluminum prices are lower than zinc prices.

Commodity price appreciation (CAGR; 30 years)

Inflation adjusted aluminum prices have fallen most

Source: Company, MOSL

Driver 2: Falling cost of production

The real operating costs of aluminum smelting have continuously declined due to technological improvements:

- The less energy efficient self baking Soderberg system of electrodes has been replaced by pre-baked electrodes
- Widespread use of point feeding system of raw materials - alumina, cryolite or fluoride
- Improved cell design
- Increased current density, as the industry moved from 50kA cells to 400-500kA cells.

As a result, specific energy consumption has fallen 15-20% over the last 30 years.

Power consumption

Specific energy consumption has fallen 15-20% over last 30 year

Source: IAI

Real alumina prices have fallen at CAGR of 3.8% although nominal prices increased at CAGR of just 1.6% over last 30 years...

Alumina prices too have remained stable and hovered around USD200/ton between 1980 and 2004. The prices of alumina too shot up in 2005-2006 due to surge in Chinese imports, but have cooled since, as China added large capacities. Alumina prices now hover around USD320/ton. Adjusted for inflation, alumina prices have fallen at a compounded annual rate of 3.8% though nominal prices have increased at a CAGR of 1.6% over the last 30 years largely due to oversupply of bauxite.

Effective years of resources at current rate of mine production

...largely due to oversupply of bauxite

Source: USGS, BGS, MOSL

Driver 3: Newer applications

Aluminum is far less exposed to construction sector

Aluminum is far less exposed to the Construction sector as compared to steel. Construction (51% of steel demand) and Shipping (5% of steel demand), which are facing headwinds due to slowdown of the investment cycle, accounts for 56% of steel demand. For aluminum, Construction accounts for just 25% of demand.

Aluminum consumption by industry

Steel consumption by industry

Source: LME

Source: WSA

This is one of the reasons, why aluminum is far less exposed to the slowdown in fixed asset formation. During 1971-2001, per capita steel consumption fell by 15-20%, while aluminum per capita consumption increased 30-35%.

Aluminum: Per capita global consumption (kg)

Source: USGS, WB, MOSL

Steel: Per capita global consumption (kg)

Source: WSA, WB, MOSL

Aluminum has been continuously finding new applications. During the world war, aluminum found uses in military applications. Post war, aluminum moved into building/construction. The aluminum beverage can emerged in 1959, when Coors introduced the first all-aluminum seamless two-piece beverage container.

Aluminum: Continues to find new uses

Source: USGS, Rio Tinto

Transportation, which accounts for ~24% of aluminum consumption alone will lead to 2% CAGR growth in global consumption

High energy prices have forcing increased aluminum use in auto

In order to achieve stricter norms Automobile manufacturers are increasing looking towards light weighting vehicles

Transport: Strong growth driver

During the oil crisis in the 1970s, car manufacturers began looking for ways to reduce fuel consumption. The best method was to reduce vehicle weight, and to do so, they began substituting steel with aluminum. Reducing the weight of an average size car by 100kg helps to save 700 liters of fuel during its life. Nowadays, 110-165kg of aluminum is used in the production of an average car, which helps to bring down the dead weight of the fully-loaded vehicle by a third. Though 100kg of aluminum costs ~USD140 more, it helps to save USD700 over the life of the vehicle, assuming fuel prices at USD1/liter. The lower weight reduces design requirements as well.

Growing use of Aluminium in European cars (kg/vehicle)

Source: EAA

Aluminum has 1/3rd the density and 1/3rd the tensile strength of steel, which neutralize each other. Yet, aluminum structures can achieve similar stiffness and crash capabilities at 45% of the weight of steel structures because of lower density. A 50% lighter structure would still be 50% thicker than steel, which gives aluminum substantial advantage in moment of inertia, buckling, stiffness, etc.

According to some estimates, in 2012, the number of manufactured vehicles reached 82m. If aluminum components had been used, decreasing their weight by ~20%, it would have helped save ~76b liters of oil, while reducing emissions of carbon dioxide by ~177m tons.

Global emission norms becoming stricter

Source: ICCTO

Globally, governments are implementing stricter emission norms:

- **USA:** 2016 CAFE standard of 35.5 miles per gallon (mpg)
- **China:** 34mpg by 2015 in passenger cars
- **Europe:** Emission limit of 95g/km by 2020 (30% reduction)

Aluminum first found its way into petrol engines and some components. Then it moved into diesel engines and is now finding its way into hoods and other parts. We expect most road transport vehicles to be fully converted to aluminum over the next 20-25 years, driven by fuel economy, better crash strength, lower vibration and lower emission.

LME aluminum prices set to outperform

Growing demand, steepening global cost curve to support prices

- Aluminum production has been continuously relocating closer to sources of energy and bauxite to lower cost of production. US, USSR and Japan, which once produced 60% of the world's aluminum, now hardly account for 10%. In the last decade, 102% of the growth in production came from Asia. China accounted for 80% of this growth, while India and the Middle East (ME) accounted for the rest. There was an investment in capacity addition of 5m tons in the ME and ~3m tons in India in the last 5-8 years.
- China now accounts for 44% of the world's metal and alumina production, while it produces only 20% of the world's bauxite. China's dependence on bauxite imports, which is nearly 50% now, is likely to grow further to 70% over the next 5-10 years. Since 2/3rd of the world's bauxite is located in just three countries, prices of bauxite are likely to increase. Alumina prices have been continuously outperforming LME. No new investment is expected in the ME and India over the next 5-10 years. The ME is no longer offering cheap gas because over-investment in LNG infrastructure has brought gas closer to energy deficit markets of India, Korea and Japan. Price of USD4-5/mmbtu (more than 5% of coal price in USD/ton) makes natural gas uneconomical for power generation. India has over-invested in aluminium capacity. Prices of Chinese aluminum are increasing due to CNY appreciation, higher cost of bauxite and rising labor cost.
- Under tremendous cost pressure, China is trying to relocate some capacities closer to the coal belt, but this is resulting in greater distance for transport of bauxite and higher labor cost due to extreme climate. Fears over compression in spot premiums are irrelevant because total aluminum prices (LME + premiums) matter to both producers and users. Notwithstanding oversupply, the young metal is set for outperformance over the next 5-10 years on the back of stronger demand fundamentals, changing dynamics of alumina/bauxite pricing and appreciating CNY.

Smelting relocating closer to low cost energy sources

Today, the global aluminum industry has only a bare resemblance to what it was in the early 1970s. The most important structural changes are: (1) geographical relocation of bauxite, alumina and aluminum production centers, (2) shifts in the degree of concentration and integration, (3) emergence of new consuming regions, development of new end-use markets and threat of substitutes, including recycled metal, (4) historical decline in real prices of the metal and recent upward shift in the industry cost curve, (5) market adjustment mechanisms and, (6) more recently, the rising popularity of commodities as an asset class.

Region-wise share in global aluminum production

Source: IAI, USGS

Developed countries have lost share in global production

In 1972, bauxite production was dominated by four countries - Australia, Jamaica, Suriname and USSR, which together held 60% share of the global market. Today, of these four countries, only Australia is on the list of top six producers. Even greater geographical shifts have happened in alumina production. In 1972, over 45% of the global alumina production was concentrated in five industrialized countries, poorly endowed with bauxite reserves: United States, Japan, Canada, France and Germany. The other major producers were Australia (13%), USSR (12%), Jamaica (9%) and Suriname (6%). Today, of these countries, only Australia is still a significant producer. Alumina production (ex-China) has shifted from the industrialized or aluminum producing countries to bauxite producing regions.

Aluminum production shifting to Asia

Major geographical shifts have also occurred in aluminum production. The United States, USSR and Japan accounted for ~60% of the global primary production in 1972. Today, their corresponding share barely exceeds 10%. Norway, Germany and France have also been replaced on the list of top aluminum producers. Over the last 10 years, 102% of the production growth came from Asia. China alone contributed to 80% of the growth in aluminum production, with the Middle East (ME) and India accounting for the balance.

Region-wise aluminum production (m tons)

Source: IAI, USGS

China, India and Middle East countries have been driving production growth, while smelters are closing in high cost developed world

China's share in global aluminum production has increased from 6% to 44% in last 2 decades

China has gained share on strong domestic demand: China, which produced less than 6% of the world's primary aluminum (or 1.15m tons) in 1992 and 17% in 2002, produced 44% (or ~20m tons) in 2012. Strong demand and abundant coal supply were the primary drivers of production.

China aluminum: Per capita consumption continues to grow (kg)

Source: USGS, IMF, MOSL

Middle East has attracted investments on low cost energy: The Middle East (ME) has come a long way from nowhere in the last 5-6 years. Apart from Dubai, Alba and few smelters that had aggregate capacity of ~2m tons, there were no other significant capacities in the region. Driven by rise in petro dollar income, these countries attracted investments in smelting capacity. Nearly 5m tons of capacities were planned, attracted by cheap gas (translating into cheap energy). Though some of the planned projects did not take off, smelting capacity in the region has already increased to 4.4m tons. Another 1.34m tons is likely to be commissioned over two years, taking total capacity in the region to 6m tons.

Nearly 5mtpa of capacities were planned attracted by cheap energy in the form of gas

Aluminum smelting capacity in Middle East

| Company | Country | Capacities (ktpa) | | | Remarks |
|--------------|--------------|-------------------|--------------|--------------|---------------------------|
| | | Existing | Project | Total | |
| Ma'aden | Saudi Arabia | | 740 | 740 | Expected to start in 2013 |
| EMAL | Dubai | 700 | 600 | 1,300 | Expected to start in 2014 |
| Dubal | Dubai | 990 | | 990 | |
| ALBA | Bahrain | 870 | | 870 | |

India's production has grown on strong domestic demand and low cost advantage: India produced just 513k tons of aluminum in FY92, which grew slowly over the next 10 years to 638k tons in FY02. However, in the last 10 years, aluminum production has accelerated, driven by robust domestic demand. Strong metal prices and low cost advantage have brought significant investments into India.

Aluminum production grew 3x in 10 years

Indian demand and supply

Source: Company, MOSL

Hindalco, which produced only 261k tons in FY02, has continuously been investing in greenfield projects in India. Hirakud, a low cost smelter, is one such successful project. Hirakud enjoys the advantage of low cost energy due to associated captive coal mine and has been gradually increasing capacity. Hindalco has undertaken three more greenfield projects of 359k tons in India. Mahan and Aditya are in advanced stages of completion. Hindalco's capacity will soon reach 1.33m tons.

Indian aluminium production

Source: Company, MOSL

Nalco, which produced 232k tons in FY02, has expanded capacity to 460k tons. However, capacity utilization has fallen to 70% due to shortage of coal and weak LME. Once its own captive coal mine is commissioned, production will ramp up. Balco used to operate an inefficient 100k ton smelter, which was mothballed post the financial crisis of 2008. It commissioned a new and efficient 245k ton smelter in FY06, which is running at over 100% capacity. Further, Balco is in advanced stages of 325k ton expansion. Thus, its total capacity will increase to 570k tons. Vedanta Aluminum (VAL) is a new greenfield project in Odisha. VAL has successfully commissioned a 500k ton smelter at Jharsuguda and a 1m ton alumina refinery at Lanjigarh. VAL had planned smelter expansion to 1.75m tons and refinery expansion to 6m tons. However, the cancellation of bauxite mining lease for Nyamgiri has forced VAL to put the expansion on hold.

Chinese region-wise bauxite production (%)

Source: Hydro

Relocated smelting driving bauxite trade and prices

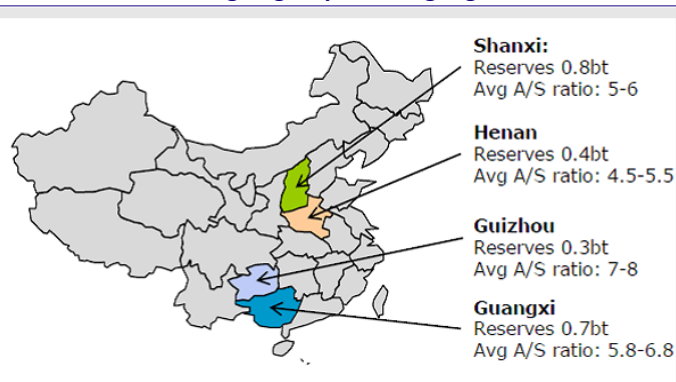

Chinese aluminum production thrived on low cost (subsidized) energy, low labor cost, low project cost and low capital cost. However, China is disadvantaged in terms of bauxite. The bauxite found in China is predominantly Boehmite, which is difficult to digest. It needs to be heated to 240°C, while the more commonly used Gibbsite can easily be digested at 145°C. Hence, the cost of production of alumina from Boehmite is much higher. Further, China produces only 20% of the world's bauxite, while it produces 44% of the world's aluminum. More over China bauxite quality is deteriorating fast. China is dependent on imports of bauxite and alumina. Indonesia has been the biggest supplier of bauxite to China and had ~70% share in total imports. Australia, the world's largest bauxite producer, is the second largest supplier to China.

China's dependence of bauxite imports is on rise

Bauxite: China's imports as percentage of world production

*Percentage on 12 month average basis

Source: Bloomberg, MOSL

Even before China began importing bauxite in big way, alumina imports used to feed the smelters in the country. However, the spike in alumina prices over 2004-2006 led to huge investments in alumina refineries. This eased the pressure on alumina prices, but China's dependence on bauxite imports has increased. Constrained by domestic supply of bauxite, Chinese smelters depend on imports of bauxite and alumina for more than 50% of their metal production.

Domestic bauxite hardly meets 50% of China's requirement

Implied imports of bauxite (including alumina) as percentage of China's total consumption

*Percentage on 12 month average basis

Source: Company, MOSL

Chinese smelters have gradually lost their cost advantage. While China is disadvantaged in terms of bauxite, its labor and power costs have increased over the last 4-5 years, taking it to the top of the cost curve. Many of the high cost smelters continue to operate with the help of state subsidy. Some have begun relocating within China from the coastal region to the hinterland and close to coal mines. This will help reduce energy, but the cost of alumina/bauxite/labor will be higher. Further, capital cost, though still low for state-owned enterprises, has started inching up.

China: Average cost of imported bauxite (USD/ton)

The cost of imported bauxite is inching up...

*Cost on 12 month average basis

Source: Bloomberg, MOSL

The primary reason for increase in bauxite cost has been declining supplies from Indonesia. Supply of bauxite from Indonesia has shrunk due to government measures to restrict bauxite exports from January 2014. Indonesia has already announced 20% export tax, which it intends to increase progressively.

Bauxite prices are inching up in China although aluminum and sea freight are oversupplied

Source: ABx

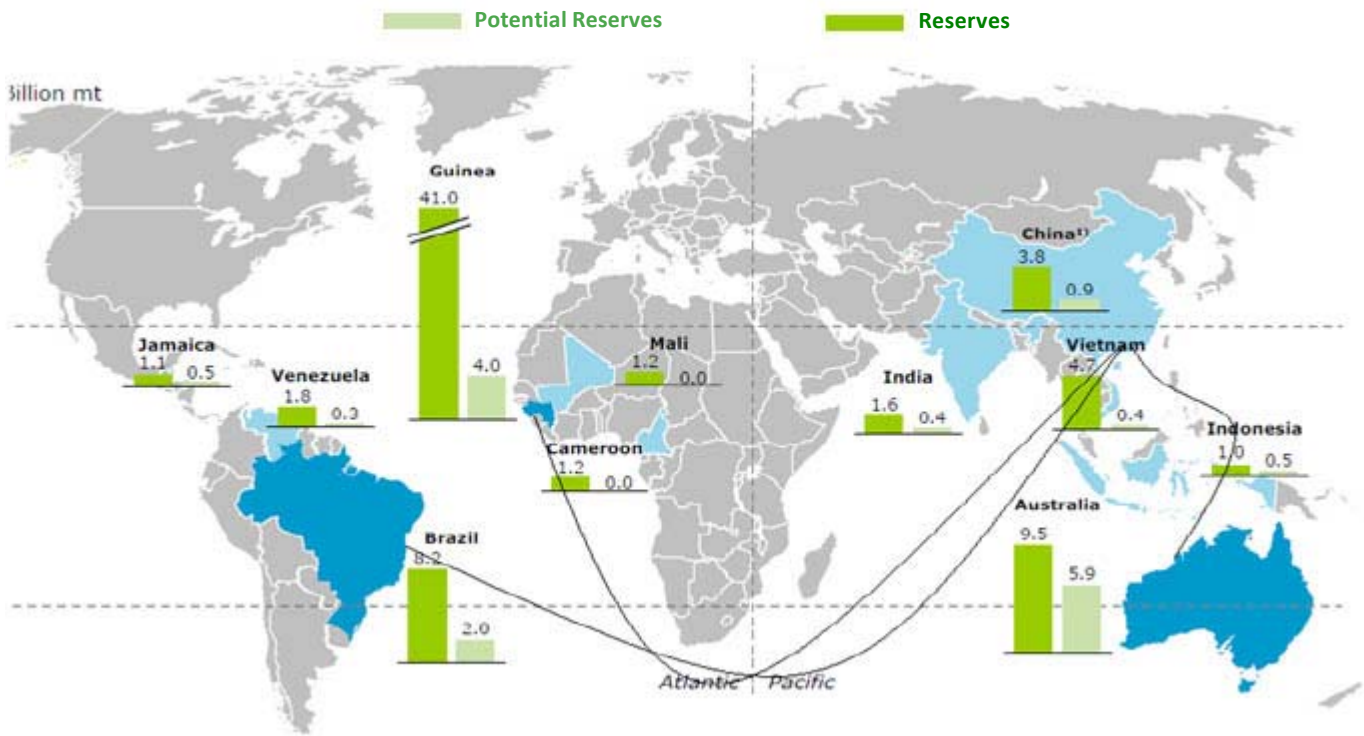

China: Country-wise share in bauxite imports

...because supply from low cost Indonesia is shrinking

Source: Bloomberg, MOSL

Bauxite may need to be transported over longer distances due to large investments in alumina refineries in China

Source: Hydro

Though bauxite (like iron ore) is abundant in the world, 2/3rd of it is located in three countries - Australia, Brazil and Guinea. Since bauxite is a low value resource, freight plays an important role in total landed cost of bauxite. Alternative supplies of bauxite are much more expensive for China.

Landed cost of imported bauxite at Chinese ports (USD/ton)

Western Hemisphere bauxite Cost ~USD25/t more due to high freight cost

Source: Bloomberg, MOSL

Before supplies from nearby countries like Indonesia stagnate or dry up, China has started looking for alternate suppliers. Vietnam holds the world's 4th largest bauxite reserves but not much of it is mined. Mining plans have met with strong criticism from scientists, environmentalists and Vietnam's general population. Forests and agricultural land used by coffee and tea farmers are threatened by the plans and opponents have raised concerns about the toxic waste red mud generated in bauxite

refining. Vietnamese General, Vo Nguyen Giap has strongly criticized the mining plans, saying that a 1980s study led to experts advising against mining due to possibility of severe ecological damage. This leaves China dependent on supplies from Australia, Brazil and Guinea. Miners like Rio Tinto (Rio) and Australian Bauxite (ABx) are gearing up to supply 30m tons and 10m tons, respectively. Rio's ore will be Boehimite, while ABx will be mining Gibbsite.

Underinvestment in bauxite mining, stronger than expected growth in demand from China may change the dynamics of bauxite pricing like that of iron ore in last decade

Though China's per capita consumption of primary aluminum has jumped sharply to 15kg in 2012, it is still long way before it matures. Developed countries like USA consume 20-30kg (including recycled metal). Being a young metal with low exposure to Construction, aluminum less exposed to economic volatility. No country has yet seen peak consumption. China's consumption of aluminum is likely to nearly double over 10 years. This would mean that China will have to import nearly 70% of its bauxite requirements. Underinvestment in bauxite mining and stronger than expected demand from China may change the dynamics of bauxite pricing.

China's share in global production (%) and its bauxite import dependence (%)

Source: USGS, MOSL

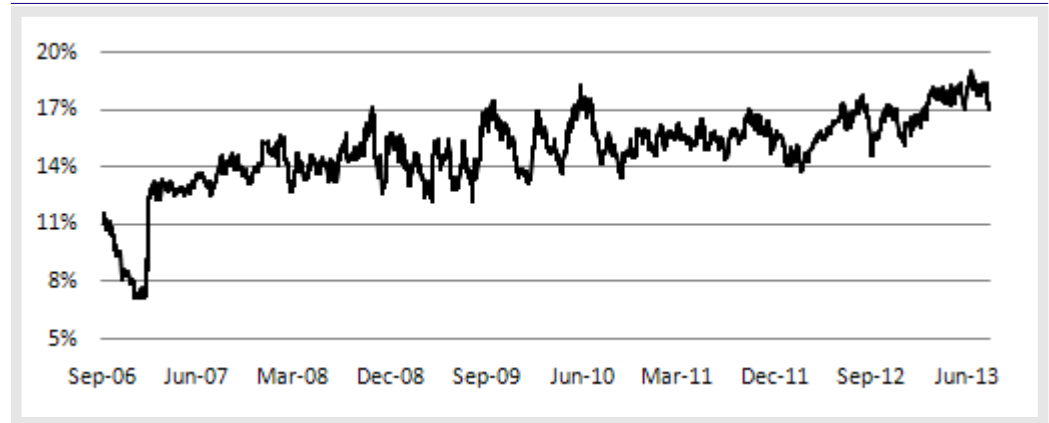

China's dependence on bauxite imports will rise

We expect the world's aluminum production to grow at a CAGR of 4.1% over 2012-2022 (v/s 5.6% over 2002-2012). This would mean that world bauxite (adjusted for grade deterioration) production will need to increase by 51% to 397m tons. China's aluminum production and consumption will nearly double. Chinese bauxite production is likely to increase at slower pace due to limited reserves in the country.

We estimate that bauxite production outside China will need to increase by 115m tons to 330m tons over next 10 years (2012-2022). China's bauxite imports will likely increase from 45m tons currently to 113m tons by then. With Indonesia putting restrictions on exports with effect from 2014, there will be tremendous pressure on bauxite production in other parts of the world. China will have to rely on the western hemisphere for supply of bauxite. This will increase the average ton-mile cost of transport, boosting the prices of bauxite. Though alumina production can be ramped up in other parts of the world (ex-China), the overinvestment in Chinese alumina refineries does not allow their ramp up. Bauxite prices need to rise high enough to force shutdown of Chinese alumina refineries. In the mean time, alumina prices are outperforming LME.

Alumina market is tighter than aluminum

Alumina prices as a percentage of aluminum LME prices (%)

Source: Bloomberg, MOSL

Middle East - losing low cost energy advantage

Low cost gas has attracted large investments in aluminum smelting in the last decade in Middle Eastern countries. Nearly 5m tons of new capacity was planned. Smelting capacity in the region has already increased to 4.4m tons. Another 1.34m tons of smelting capacity is expected to be commissioned over the next two years. This will take the total capacity in the region to 6m tons.

Cheap gas invited large investment in aluminum smelting

Gas used to be flared because high cost of compression and infrastructure was not justified at low prices of energy. ME countries were too happy to offer low cost gas. This attracted large investments in the ME.

With crude oil prices sustaining at higher levels, the pricing dynamics of gas exported in the form of LNG have changed significantly. The export realization of LNG has increased many folds over the last five years.

LNG export prices (USD/mmbtu, fob Qatar)

Source: MOSL

Gas is becoming more valuable for Middle East countries

Though the ME accounts for 38% of the world's proven gas reserves, large parts of the reserves are concentrated in Iraq, Iran and Qatar. However, merely being endowed with large gas reserves does not mean that all the gas can be made available where/when needed.

- Associated gas depends on crude oil production levels.
- There are quality/cost constraints (example: multi/billion USD projects to treat sour gas).
- Reliance on non-associated gas in complex formations is increasing (high costs).

- Large volumes of gas are needed for injection in oil fields (Iran and the UAE).
- Regional gas infrastructure remains limited compared to other regions of the world.
- Geopolitical and commercial considerations have constrained intra/regional trade.

Qatar is the only significant surplus country in the world that has also set up nearly 75m tons of LNG export capacities.

Cheap gas is not available any longer

The ME countries are no longer offering cheap gas to energy intensive projects. Several projects in the region have been shelved for want of low cost energy and no new projects are being announced.

Gas doesn't have any comparative advantage over coal

Gas does not have any comparative advantage over coal in power generation unless subsidized. If gas is delivered at USD5/mmbtu, the fuel cost in power generation will be US\$3.87/kwh as explained in the following exhibit. To get similar fuel cost of power generation, coal prices can be as high as USD100/ton. In other words, till such time as coal price is less than 20x gas price, it is more competitive.

Power generation: comparative advantage for coal

| | Units | Gas | Units | Coal |
|-------------------|-----------|-----------|-----------|-------|
| Price | USD/mmbtu | 5 | USD/ton | 100 |
| Calorific value | btu/mmbtu | 1,000,000 | kcal/kg | 6,000 |
| Cost per unit | US\$/btu | 0.0005 | US\$/kcal | 0.002 |
| Station heat rate | btu/kwh | 7,744 | Kcal/kwh | 2,200 |
| Fuel cost | US\$/kwh | 3.87 | US\$/kwh | 3.67 |

Source: MOSL

Coal is more competitive as long as it is less than 20x of gas price

We have tried to compare the price of coal (USD/ton) with the price of LNG (USD/mmbtu) delivered in Japan, and the prices of Henry Hub liquefied LNG (theoretical) delivered to the Asian markets, Germany and the UK. In the last 10-12 years, the coal to LNG price ratio has never crossed 20x. This implies that coal has always been more competitive than natural gas in power generation.

Coal to LNG price ratio (x)

Source: Bloomberg

Coal has been more competitive

Now, most LNG contracts are being linked to 14-15% of crude oil prices. Even if ME LNG were to compete with North American gas (Henry Hub index) in Asian markets,

the netback realization for ME countries will still be above USD4-5/mmbtu due to proximity to Asian markets. However, this is a theoretical calculation because of insufficient supply chain between Henry Hub and Asian markets. If the supply chain is established, the netback realization for ME gas will be even higher. Hence, we believe that that the ME will no longer offer subsidized gas for new aluminum smelting projects because the focus has now shifted to value maximization.

China - costs are moving up

China continues to invest heavily in aluminum smelting on the back of energy cost advantage. Though the cost of power has been increasing in the eastern part of the country due to rapid urbanization, it is lower in the western part, where the coal mines are located. The trend of relocating smelters closer to coal mines has already started. This will help smelters to bring down the overall cost of energy in local currency.

CNY appreciation is adding to operating costs: The continuous upward pressure on the value of the CNY in terms of the USD will keep eroding China's cost advantage.

CNY/USD rates

Chinese Yuan has natural tendency to appreciate...

Source: Bloomberg

The Chinese currency has a natural tendency to appreciate because China runs a secular trade surplus with USA. China allows the CNY to appreciate in a narrow band.

China: Trade surplus (USD billion per month)

...because China runs trade surplus

Source: Bloomberg

Alumina and bauxite too are getting expensive: With China's dependence on bauxite imports rising from 50% to 70% over the next 5-10 years, bauxite and alumina prices are likely to outperform LME. Rising relative cost of bauxite and/or alumina with respect to LME will keep pushing Chinese smelters (whose share in aluminum production is likely to increase from 44% in 2012 to 58% by 2022) upwards on the cost curve.

Alumina prices as a percentage of LME aluminum prices

Source: Bloomberg, MOSL

Chinese smelters are already at the high end of global costs, but continue to operate with the help of state subsidies on energy and borrowing costs. Relocation of some of the smelting capacities closer to energy sources will help achieve some cost reduction, but discontinuation of state subsidies and CNY appreciation would mean no advantage to smelters.

Global cost curve

Source: Industry, MOSL

Global cost curves on 100% capacity basis

Source: Industry, MOSL

LME aluminum prices to move up

Rising cost of setting up projects in most parts of the world and falling return on capital employed (RoCE) has choked investments in the sector across the world, barring China. Leading aluminum producers - UC, Rusal, and Alcoa - have been mothballing and/or permanently shutting high cost smelters.

Specific capital cost (USD per ton of integrated capacity)

Source: MOSL

Return on capital employed

Source: MOSL

Low returns and shortage of capital has choked investment everywhere but China

Rising share of Chinese smelters will drive cost curves steeper

High LME inventories is on everyone's mind, but producers are not as much concerned

Chinese demand and smelters will drive cost curves steeper: With choking of investments in the world (ex-China), growing demand and rising cost of production for Chinese smelters (driven by CNY appreciation and rising cost of alumina/bauxite) are likely to drive the cost curves steeper. We expect aluminum prices to trend upwards over the next 2-3 years. There appears to be excessive pessimism in the financial markets because of oversupply. However, the producers are not as much concerned because rising spot delivery premiums have cushioned the impact on total aluminum prices.

Quarterly average aluminum prices (USD/ton)

Source: Bloomberg

Unwinding of warehousing queues will put pressure on LME prices - a myth

Despite lengthening warehousing queues, no user has suffered production disruption due to shortage of metal

It is believed that unwinding of warehousing queues will bring additional supply to the market, putting pressure on LME aluminum prices. We concede that aluminum, which is currently locked in warehousing queues, will become available to users. However, it needs to be noted that this metal was available to end users immediately after it was produced. It was because of overproduction that the metal landed up in warehouses.

Problem lies elsewhere in hardening of spot deliver premiums which they are not able to hedge

Protests by metal re-rollers like Novelis are not really about non-availability of primary metal. Their problem lies elsewhere in hardening of spot delivery premiums, which they are not able to hedge. Once spot premiums start coming off (they have started now), the complaints will disappear. We are not aware of any re-roller's production getting disrupted due to non-availability of primary metal.

Aluminum: Spot delivery premiums (USD/ton) have started to come off

Source: Bloomberg

Key question - will there be pressure on owners of LME inventories to sell this metal in physical market?

The key question is, "Will there be pressure on owners (or financiers) of LME inventories to sell these in the physical market?" We believe that the funding of LME inventories is driven by pure arbitrage between current and forward markets versus cost of carry. One may argue that hardening interest rates due to tapering of bond buying by the Fed (USA) will increase cost of carry. Yes, higher interest rates drive cost of carry, but what about other components like rents and incentives?

The warehousing rent have more than doubled over last few years - The rents can fall 60-65% due to new investment in East

Warehousing rents have more than doubled over the last few years without corresponding increase in the cost of creating warehousing space (real estate and labor costs have remained subdued in the West). Perhaps, this is what drew investment bankers like Goldman and JP Morgan to owning warehouses. More warehouses are expected to be created in Asia over the next few years due to shifting of the center of gravity of the global metal trade to the East and ownership of LME to a Chinese (Hong Kong). This will bring down warehousing rents; we believe there is 60-65% downside potential in warehousing rents. We are not surprised that the investment bankers now want to exit warehousing, as they can no longer protect their margins due to the recent intervention by the US judiciary.

The warehousing business had become so lucrative that incentives were being offered to draw metal into warehouses. Ever since the new owner of LME indicated that rules would be changed to shorten the queues to 100 days, the incentives (to draw in metal) have been cut. As a result, the spot delivery premiums have started coming off. However, the forward curves are now getting steeper. This only re-affirms our view that LME inventory is unlikely to unwind. Steeper contango and lower rents will cushion hardening of interest cost.

Aluminum forward curves (USD/t)

Source: Bloomberg

Steeper Contango and lower rent will cushion hardening of interest cost

Persistent contango reaffirms that underlying demand fundamentals are strong, while costs are expected to inch up. This fact cannot be ignored or taken lightly, because forward curves of other commodities like iron ore are trading in backwardation, as supply is expected to outstrip demand over the next few years.

Total aluminum price is unlikely to change. As spot delivery premiums cool, we expect LME to inch closer to total aluminum prices

Expect LME prices to move closer to total aluminum prices: Total aluminum prices (LME + premiums) are driven by fundamental demand and supply. As the total inventories are unlikely to unwind because attractive contango will continue to fund the carry cost, we expect no change in the underlying fundamentals of demand and supply. Hence, the total aluminum price is unlikely to change. As spot delivery premiums cool, we expect LME to inch closer to total aluminum prices.

Indian smelters getting competitive again

Cost of production has peaked; profitability to improve

- India is endowed with large resources of coal (3rd largest in the world), bauxite (5th largest in the world) and labor pool (2nd largest in the world) - the key ingredients in aluminum production, and bauxite and coal mining. This gives India a natural advantage, making it one of the lowest cost producers in the world, with cost of production below USD1,000/ton a decade ago.
- The competitiveness of Indian smelters had eroded rapidly in the last five years due to change in the dynamics of coal pricing by Coal India, other input cost pressures and high inflation. However, this did not deter Sesa-Sterlite and Hindalco from investing USD8b and USD6b, respectively, in the last 4-5 years. Falling RoI and huge capex burden led to huge stock underperformance.
- We believe that India's aluminum sector is now set for a turnaround. Cost of production has peaked. Profitability should increase, aided by sharp depreciation of INR against USD, easing prices of inputs like coal and CPC, likely increase in LME prices and end of the capex cycle, leading to improved cash flows.

Indian smelters went up the cost curve

Nalco's operating assets are located close to bauxite and coal mines. The alumina refinery is located close to captive bauxite mines at Damanjodi, Odisha. Its smelter along captive power plant is close to MCL (Coal India's mines) in Angul, Odisha. The location advantage, mineral linkages and low labor cost led to low cost of production. However, in the last 5-6 years, Nalco has lost its cost advantage.

Average cost of production for Nalco's product mix (USD/ton)

Source: Company, MOSL

Although cost of production has increased, but it would be lower in FY15M (MTM USD/INR rate of 62.5) vs FY15E (i.e. estimate of 60)

How Nalco has gradually lost its cost advantage in the last 5-6 years:

- Labor productivity has increased only 10%, but labor cost per man year has increased 3x to USD271,000 (v/s USD50,000 in 2000).
- Coal India (MCL) used to supply 100% of Nalco's coal requirement at linkage price, which was unchanged from FY01 to FY08. However, the average cost of coal per ton has increased 3x in the last five years, because Coal India cut linkage supply and raised prices multiple times. Nalco's dependence on merchant purchase of expensive coal increased. Further, the quality of coal has deteriorated with greater incidence of rocks in the supply. This has had a huge impact on the cost of production.

- Nalco also reported a spike in consumption ratios for consumables like caustic soda due to rise in silica in bauxite.
- Cost of other consumables like CPC and caustic soda also increased.

Hindalco too witnessed most of the issues faced by Nalco. However, its cost of production declined during FY08-10 due to rising share of low cost Hirakud smelter in the production mix. The Hirakud smelter has an additional benefit of captive coal mining not available to the Renukoot smelter. The cost of production for both Nalco and Hindalco includes value addition and is, thus, not comparable to LME grade.

Average cost of production for Hindalco's product mix (USD/ton)

Source: Company, MOSL

Cost of production has started declining

Recent quarterly trends in the cost of production for Indian smelters are encouraging, though Nalco's cost of production still remains volatile due to volatility in coal cost.

Indian smelters: Cost of production of primary metal (USD/ton)

Source: Company, MOSL

Weakening INR v/s USD, easing wage inflation and input costs, and no further hike in coal prices have led to peaking of cost of production of aluminium. The drop in cost of production is likely to be sharper in the coming quarters due to steep INR depreciation from the average rate of INR56/USD in 1QFY14.

■ Power cost declining

Indian utilities and smelters are largely dependent on Coal India (CIL) for the supply of coal to meet fuel requirements for power generation. CIL supplies ~90% of its coal production through annual contracts and offers ~10% of its production through e-auctions due to logistics issues. Coal procured in E-auction gets second priority in allocation of railway rakes and often needs to be transported by road to end users. Generally, end users close to the mines bid in e-auctions.

Since the E-auction prices have cooled, we expect the average contracted (or linkage) prices too expected to remain flattish

Coal India: Average realization

Source: Company, MOSL

Over the last five years, large investments in the power sector and strong demand drove up prices of merchant power. High coking coal and steam coal prices in international market drove demand for coal from the sponge iron industry. This led to aggressive bidding in e-auctions. Average realization grew 150% to INR2,600/ton during FY12. Deteriorating financial health of power distributors and shrinking sponge iron demand and margins eased the pressure in e-auctions. The average realization in e-auctions was nearly flat in FY13 and is expected to be down 15% in FY14, with only marginal appreciation expected over the next 2-3 years.

Sharp rise in e-auction prices encouraged Coal India to hike prices of contracted quantity to utilities and switch to differential pricing for non-utility sectors like metals. Since e-auction prices have cooled, we expect the average contracted (or linkage) prices to remain flattish.

Coal: Average cost per ton for Indian metal companies

USD per ton cost of coal is on decline

*FY15M (MTM USD/INR rate of 62.5) vs FY15E (i.e. estimate of 60)

Source: Company, MOSL

The increase in average cost of coal for Indian metal companies was sharper because CIL reduced the linkage supply, forcing them to participate more in expensive e-auctions. However, the pressure now is easing. With flattish average cost of coal in INR/ton, steep INR depreciation v/s USD, the cost per ton of coal is likely to decline sharply in terms of USD.

Power & Fuel: Average USD cost per ton of metal is expected to decline sharply

*FY15M (MTM USD/INR rate of 62.5) vs FY15E (i.e. estimate of 60) Source: Company, MOSL
Costs between companies are not comparable due to vast difference in product mix and segmental reporting

■ Labor cost pressure easing

Though Indian smelters witnessed 10-50% labor productivity gains in the last decade, the annual labor cost increased 5-6x. Over the last five years, the productivity gains were little, but wages rose sharply due to large wage hikes by state-owned companies, persistently high inflation, and pressure from strong GDP growth. With GDP growth having slowed down and unemployment rising, we expect wage hikes to be moderate despite expected high inflation. Hindalco is likely to see sharp increase in productivity, as the efficient Mahan and Aditya smelters start ramping up production. The depreciating INR is likely to have greater impact on the per ton cost in terms of USD.

Labor cost: Average cost per ton of aluminum

*FY15M (MTM USD/INR rate of 62.5) vs FY15E (i.e. estimate of 60) Source: Company, MOSL

■ Other operating costs to moderate

The manufacturing industry significantly outsources repair, maintenance and other activities. Hence, contracting costs play an important part. With slowdown in construction activity, contracting costs too are likely to remain subdued. Adding the benefit of INR depreciation, USD cost would decline further.

Lower wage hikes, productivity gains, and currency depreciation reducing costs sharply

Indian aluminum: Pricing power intact unlike steel

In India, aluminum prices follow shadow pricing based on import parity costs, irrespective of local demand. The average sales premium realized by Indian aluminum smelters has very high correlation with the spot delivery premium.

Indian aluminum prices have high correlation to LME and currency

Premiums over LME: Indian smelters compared with US spot premiums

Source: Company, Bloomberg, MOSL

Indian steel prices used to have high correlation with import parity. However, the link has now got diluted due to poor domestic demand and high cost of transportation (as percentage of selling price). Steel prices are now adjusting to export parity instead. However, aluminum prices remains highly correlated to import parity, given that it (1) is a homogenous commodity, (2) has a ready market at LME, and (3) has low cost of transportation (as percentage of selling price).

Indian steel prices

The correlation with import parity has diluted due to demand weakening

Source: Steelmint, MOSLL

Margins bound to expand: The margins of Indian aluminum smelters are bound to expand with upward bias at LME, weakening INR v/s USD, and easing of input cost pressure.

Hindalco: Our top pick

Free cash flows turning positive; valuations at historical trough

- Hindalco is at an inflexion point. Operating cash flows are poised for rapid growth, as the benefits of USD8b investment have begun. Margins of the aluminum business should expand, driven by declining cost of production.
- Hindalco has near full bauxite and partial coal security through captive mines. Its balance sheet is highly geared, but it has the best cash flow hedge among Indian metal companies. Its debt maturity profile is very comfortable and back-ended.
- Free cash flows are turning positive, along with rising operating cash flows and tapering capex. The stock trades at historical trough valuations. We prefer Hindalco over Sesa-Sterlite and Nalco.

Sesa-Sterlite group less leveraged than Hindalco, but capital structure inefficient

Though Sesa-Sterlite is less leveraged at the group level than Hindalco, its capital structure is highly inefficient. Another group restructuring is inevitable once the Government of India divests its stake in Hindustan Zinc. We fear that the management may not choose the most efficient capital structure because that conflicts with its strategy of aggressive inorganic growth. Minority interest in cash-rich subsidiaries is a useful strategic leverage at the time of acquisition. Sesa-Sterlite has got de-rated and is unlikely to get re-rated until capital inefficiencies are addressed and minority interest in cash-rich subsidiaries is bought out through M&A. We maintain Buy, as SOTP-based valuations are still attractive.

Hindalco is leveraged, yet its forex debt has best cash flow hedges

Nalco's balance sheet best, but it is high up on the cost curve

Nalco has the best balance sheet, with no debt and cash surplus of ~INR50b. Falling labor productivity due to declining capacity utilization of smelter and 2-3x higher annual labor wages as compared to peers has moved it up on the cost curve, despite the benefit of captive bauxite and proximity to Coal India's mines. Nalco is long on alumina, with 60-70% of production available for third-party sale. Though metal production has declined due to difficulty in sourcing additional coal, alumina

production is rising due to the benefit of captive bauxite and recent capacity expansion. Potential upsides from Utkal-E block, further expansion of alumina refinery, weaker INR v/s USD, and peaking of labor cost as older employees retire are long-term positives. In view of the changed business dynamics and recent turn in operating performance, we believe that the stock deserves a higher EV/EBITDA target multiple of 5.5x (earlier 4x). Topping it with the value of CWIP, our SOTP-based target price is revised to INR52. We upgrade the stock to **Buy**.

Buy

At inflexion; operating cash flows to accelerate

Equity value to rise ahead of EPS growth; Buy

- Hindalco Industries (HNDL) is at an inflexion point. Benefits of the USD8b investment have started kicking in, with the start of bauxite mining, Utkal alumina refinery, Mahan smelter, and Novelis' rolling facilities in Brazil and Korea. As a result, operating cash flows are poised for rapid growth.
- Margins of the aluminum business are likely to expand, driven by declining cost of production, hardening LME prices and depreciating INR. When the coal mines associated with Mahan and Aditya smelters become operational, the average cost of production will decline further. Though the two new smelters will initially remain exposed to coal prices, their other operating costs will be much lower than the Renukoot smelter due to new technology and automation. The outlook for aluminum prices is positive because of China's rising share in global aluminum consumption and production. China's rising dependence on bauxite imports and structural CNY appreciation will result in steepening of the cost curve.
- Among Indian metal companies, HNDL has the best cash flow hedge against debt on the balance sheet. Its debt maturity profile is back-ended, providing greater comfort. With increasing operating cash flows and tapering capex, its free cash flows are turning positive. We expect equity value to increase. Valuations are attractive; re-iterate Buy.

Operating cash flows poised for rapid growth

HNDL has been able to grow its operating cash flows before working capital changes (OCFbWC) steadily over the last five years, despite volatility in metal prices and rising cost of production. There was a slight dip in OCFbWC in FY13, but increase in inventories at Novelis and reduction in payables at Hindalco India by INR38b led to a sharp decline in operating cash flows after working capital changes (OCFaWC). The excess working capital is expected to be released in FY14. OCFaWC should jump in FY14, aided by improved margins the India business and start of cash flows from the Utkal and Mahan projects.

Operating cash flows (INR billion)

Source: Company, MOSL

India business EBITDA to grow 3x

We expect quarterly EBITDA of the India business to increase gradually to 3-4x over the next 2-3 years (even at a conservative LME price estimate of USD2,000/ton), aided by 23% CAGR in both alumina and metal production over FY13-17.

India business: Quarterly EBITDA (INR billion)

Source: Company, MOSL

India business: Aluminum production (k tons)

India business: Alumina production (k tons)

Source: Company, MOSL

- The Hirakud and Renukoot smelters have overcome operating hiccups in the last two years. Margins should expand, aided by the sharp INR depreciation and cooling of input cost pressure. Nearly 85% of the cost of production is local due to integration of bauxite and coal mining, and domestic sourcing of coal, caustic soda, etc.
- The 1.5m ton Utkal Alumina refinery has started operations. Since the pricing of alumina is USD-linked while costs are INR-denominated, margins and cash flows are likely to increase as production ramps up. Utkal is a highly profitable project and there is potential to grow production further due to latent bauxite capacity.
- The 359k ton Mahan smelter has started production and full ramp-up is likely over the next 12 months. We factor commercial production of 30k tons in FY14, 150k tons in FY15, 280k tons in FY16, and 350k tons in FY17. We expect cost of production to decline from USD1,918/ton in FY15 to USD1,515/ton in FY17; the start of coal mining at its captive block should help reduce power cost from INR3/kwh to INR1.5/kwh. Though the smelter will remain exposed to market prices till the captive

coal mines begin production, other operating costs will be much lower than the Renukoot smelter due to advanced technology and higher labor productivity. We expect EBITDA/ton to increase from USD302 in FY15 to USD653 in FY17.

- The 359k ton Aditya smelter is expected to start commercial production in 2HFY15 and is likely to ramp up on similar lines as the Mahan smelter.

Novelis - USD cash flows to rise gradually

Novelis has been able to generate free operating cash flows over the last five years, barring three quarters when working capital increased due to industry-wide trend.

Novelis: Operating cash flows after working capital changes (USD million)

Novelis has solid operating cash flows

Novelis: EBITDA (USD million)

USD2b EBITDA target is delayed, but USD1.2b is very likely

Source: Company, MOSL

We expect Novelis to report gradual improvement in EBITDA over the next 2-3 years, as the benefits from the USD2b capex (spent over FY12-14) start kicking in. Novelis commissioned its 220k ton Brazil FRP expansion in December 2012, 350k ton Korea expansion in July 2013 and 200k ton US auto line in July 2013. It intends to increase recycling from 40% currently to 80% by 2020. It commissioned a 265k ton recycling facility in Korea in October 2012 and is likely to commission a 190k ton facility in Brazil by December 2013 and a 250k ton facility in Germany by July 2014. Though slower can and construction demand has dented its target to expand annual EBITDA to USD2b, we expect Novelis' EBITDA to increase every year, aided by benefits of its USD2b capex and cost cutting measures.

Novelis has highlighted certain headwinds in the last 3-4 quarters that have impacted margins. However, some of these factors are likely to turn favorable soon.

Novelis: Concerns highlighted

| | 1QFY13 | 2QFY13 | 3QFY13 | 4QFY13 | 1QFY14 |
|------------|--|---|---|--|--------|
| N. America | | | Reduced Scrap Benefits and ERP Implementation | | |
| Europe | | | Pricing pressure in specialities negative currency impact | Pricing pressure in can business | |
| S. America | | | Pricing pressure on Industrial FRP forward | Moderating Can demand going | |
| Asia | | Pricing pressure and higher regional premiums | High spot premium, SHFE LME arbitrage negative | High spot premium, SHFE LME arbitrage negative | |
| General | Competition in Foil Segments from unorganized players, Slowdown in Electronics segment | | Pricing pressure in N.America, Europe and Asia. | | |

Weak dollar against local currency is preferred in N.America, Europe and Asia. However costing in Brazilian Real and dollar revenue means strong dollar is preferred in Brazil

Source: Company, MOSL

Very strongly growing auto demand is switching FRP capacity away from can business

- **US can business to regain pricing power in 12-18 months:** US markets have witnessed slowdown in can demand, leading to decline in capacity utilization and pricing pressure. However, strong growth in demand from the Auto sector, driven by the need for lighter vehicles, is driving the switching of FRP capacity away from cans to auto lines. Novelis, Alcoa, Aleris and other key players are investing in heat treatment lines to meet the ~25% CAGR in demand. Also, demand for cans remains strong in Europe, South America and Asia. We expect the industry to regain pricing power over the next 12-18 months.
- **Foil business exited:** Novelis exited the foil business in Europe in FY13 due to intense competition from the unorganized sector. EBITDA loss has been only marginal.
- **SHFE-LME arbitrage has turned positive:** In 3QFY13, Novelis had highlighted that Chinese FRP was gaining an edge in the Asian markets because sourcing metal in China was relatively cheaper, with the SHFE-LME arbitrage turning negative. The SHFE-LME arbitrage has once again turned positive.

SHFE-LME arbitrage (USD/ton)

Note: SHFE - Shanghai Futures Exchange

Source: Bloomberg

Novelis should regain its competitive advantage in sourcing inputs

Novelis margins are hurt because its finished product contracts are linked to LME rather than total aluminum prices

- Higher spot premiums, lower benefit of scrap recycling two sides of same coin:** Though these two issues appear independent, they are really two sides of the same coin. As evident in the following exhibit, the spread between LME and UBC prices has narrowed over the last five years. However, the spread between total aluminum price (LME + spot delivery premium) and UBC price has remained unchanged. Novelis' margins are hurt because its finished product contracts are linked to LME rather than total aluminum prices. It is able to hedge LME but not the spot delivery premiums.

Spread between UBC scrap and metal prices (USD/ton)

Note: UBC - Used Beverage Can

Source: Industry, MOSL

The spreads between total aluminum price and recycled UBC prices is relatively stable

We see no reason why the spreads between UBC and aluminum price should narrow in a structural manner

We see no reason for a structural narrowing of the spread between aluminum and UBC prices. Recycling capacity has never been in shortage; the lead time for setting up recycling projects is less than a year. Hence, the spread should be driven by conversion costs, which are largely stable in developed nations. We expect LME to resolve the warehousing queue problem soon. Once the spot delivery premiums start cooling (already started) or stabilize, Novelis' margins will start recovering.

Aluminum: Spot delivery premium (USD/ton)

Source: Bloomberg

Along with falling spot premiums, Novelis will no longer be hurt

Consolidated EBITDA to grow at a CAGR of 19%

We expect HNDL's consolidated EBITDA to grow at a CAGR of 19% to INR162b by FY17, assuming a conservative LME price of USD2,000/ton. EBITDA of the India aluminum business will increase 3x, while the copper conversion business and Novelis will post steady earnings growth.

Consolidated EBITDA (INR billion) to grow at 18% CAGR

Consolidated EBITDA (USD million)

Source: Company, MOSL

Free cash flows are turning positive

HNDL invested heavily in the last three years, driven by (1) the opportunity to secure coal and bauxite resources for the next 25-30 years for its India aluminum business, and (2) opportunities for Novelis in increasing recycling, expanding auto lines in US and China, and expanding FRP capacities in Brazil and Korea. Though staggered capex would have been less risky, it would have meant lost opportunities.

Free cash flows after capex (INR billion)

Source: Company, MOSL

Free cash flows are turning positive as Hindalco exit investment phase

Equity value to rise ahead of EPS growth

HNDL's heavy capex and resultant negative free cash flows have been a drag on its equity value. Conservative investors are put off by a rising net debt to EBITDA ratio. With rising EBITDA and a declining net debt to EBITDA ratio, equity value should increase. We value Hindalco at INR 165 based on SOTP (42% upside). Re-iterate **Buy**.

Net debt to EBITDA ratio (x)

Deleveraging will drive stock price 2 to 3x despite ignoring metal price upside

Source: Industry, MOSL

Source: MOSL

EPS growth, though, is likely to be elusive for the first few years. As explained in the following exhibits, the impact of interest and depreciation will erode the growth in EBITDA.

India business: Quarterly depreciation (INR billion)

Along with commissioning of Greenfield projects, the depreciation charge will rise

India business: Quarterly interest expense (INR billion)

Interest expense will start tapering off from 1QFY16 as debt gets repaid from internal accruals

India business: Incremental earnings (INR billion) w.r.t. 1QFY14

There is large growth in EBITDA but, the PBT will start rising from FY16

India business: Quarterly PAT (INR billion)

Quarter PAT will remain range bound due to negative contribution of Mahan and Aditya

Source: Company, MOSL

1 year forward P/E (x)

It is important to note that investors are already factoring high interest and depreciation charge as it is evident from sharp PE de-rating

1 year forward EV/EBITDA (x)

EV/EBITDA is more appropriate measure of valuation as it reflects cash flows better

Stock performance (1 year)

Simpler group structure, but high capital inefficiencies

High quality assets at low valuations; maintain Buy

- The merged Sesa-Sterlite is a highly diversified commodities player, with high quality assets such as Hindustan Zinc (HZ), Cairn India (CAIR), overseas zinc business, and domestic iron ore business. The group structure has become simpler post restructuring, but the capital structure is far more inefficient than before. Nearly 85% of group debt (~INR800b) will now be in the standalone entity, which accounts for just 20% of group EBITDA. On the other hand, ~INR600b (FY15E) of cash would be lying in the balance sheets of CAIR and HZ, which is not fungible.
- We believe that operationally, Sesa-Sterlite is an extraordinary entity. However, financial management has been below average. Despite generating superior margins, the stock has been an underperformer. A very likable set of assets have been trading at low valuations because of difference of opinion between minority investors and the promoters on capital allocation.
- Assuming LME price of USD2,000/ton for aluminum, USD1,900/ton for zinc, and USD2,100/ton for lead in FY15, our SOTP-based valuation works out to INR214/share. Currently, the INR/USD rate is higher than our assumption of 60 for FY15. While a weaker INR results in ballooning of forex debt, there is greater gain in EBITDA for the oil and zinc-lead-silver businesses. We maintain Buy.

Simpler group structure but inefficient capital structure

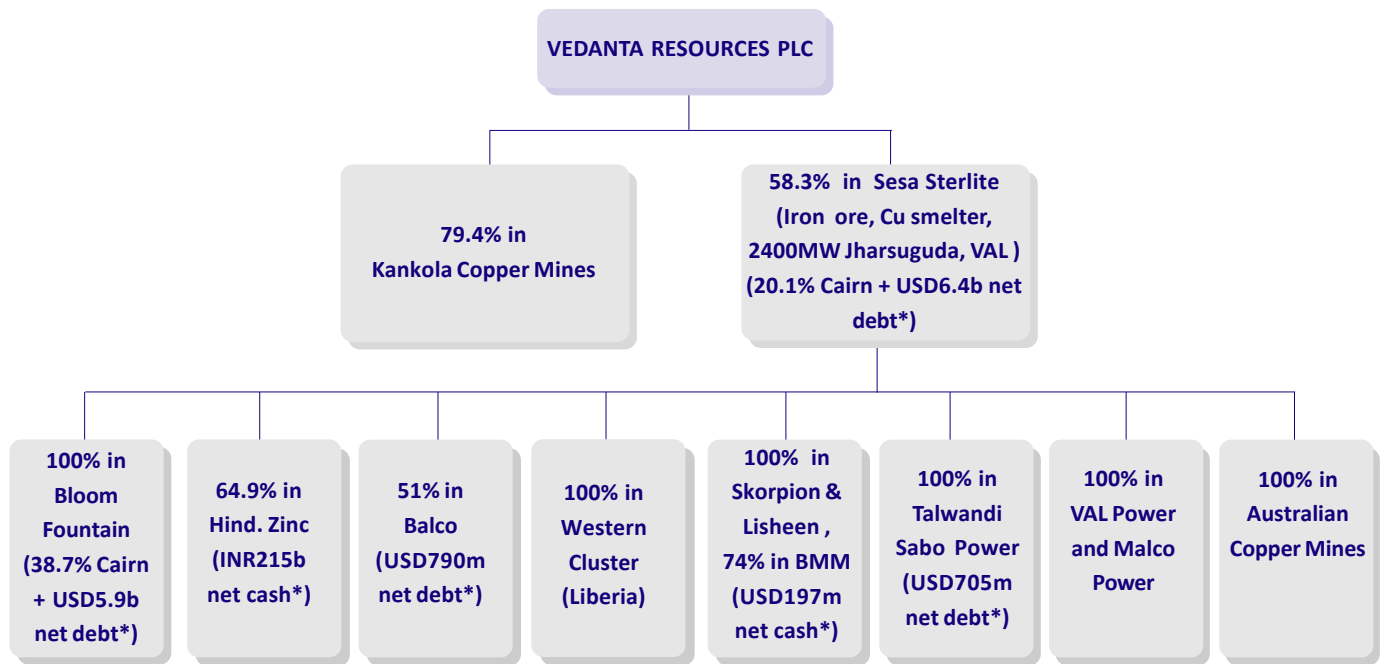

The merged Sesa-Sterlite is a highly diversified commodities player, with high quality assets such as HZ, CAIR, overseas zinc business, and domestic iron ore business. Even the less profitable aluminum and power businesses boast high operational efficiencies, but are exposed to third-party coal and bauxite. The group has demonstrated exemplary execution in zinc-lead-silver and iron ore businesses.

FY15 EBITDA distribution on attributable basis

Source: Company, MOSL

Group structure is now simpler

*As of March 2013

Source: Company, MOSL

In the new restructured Sesa-Sterlite, there has been some simplification of assets, but the capital structure is far more inefficient now than it was before. Nearly 85% of group debt (~INR800b) will now be in the standalone entity (and its investment companies like Bloom Fountain), which accounts for only 20% of the group EBITDA (INR40b-60b). On the other hand, ~INR600b (FY15E) of cash would be lying in the balance sheets of CAIR and HZ, which is not fungible.

Pro forma debt

Pro forma cash and equivalents

Source: Company, MOSL

Delisting of HZ and merger with SS is the only option which will bring capital efficiencies, but management may not necessarily choose this option

Will OFS of HZ improve capital efficiencies?

It is widely believed that the Indian government needs to urgently divest in HZ and Balco so that much needed monies can be raised to partially bridge the fiscal deficit and meet divestment targets. If Sesa-Sterlite funds the purchase through forex borrowings, the pressure on INR/USD rate too will ease to some extent. There are certain hiccups in an offer for sale (OFS), one being the limit of 25% of the size for a single investor. Assuming this is eased, even if the government launches an OFS, there could be multiple possible outcomes.

- If Sesa-Sterlite is able to grab the entire issue (29.5% of equity), the promoters' holding will increase to ~94.4%. In this case, Sesa-Sterlite will have to either delist HZ or bring down its holding to 75% to comply with SEBI guidelines for listed companies.
- If Sesa-Sterlite gets only part of the issue, with the rest being grabbed by other institutional investors or HNIs/retail investors, then the promoters' holding will be between 64.9% and 94.4%. Sesa-Sterlite will have to choose from the following: keep HZ listed, or delist and merge with itself.
- We believe delisting HZ and merging it with Sesa-Sterlite is perhaps the best option in terms of capital efficiency - HZ's cash will become fungible and available for servicing CAIR's acquisition debt.
- If Sesa-Sterlite chooses to keep it listed, the capital inefficiencies will remain or increase. Debt will rise to the extent of shares bought in the OFS. This will not resolve any of the debt servicing issues. Sesa-Sterlite could try to secure ICD from HZ or push down Bloom Fountain with USD5.9b of debt into HZ. In either case, HZ's minority shareholders will be disgruntled.

Given the past track record and the management's indication in a conference call, the probability of keeping HZ listed is high. This will lead to de-rating of Sesa-Sterlite because it derives a large part of its valuation from HZ. One may argue that some part of this de-rating is already in the stock price - in the last couple of years, Sesa-Sterlite has attracted lower valuations than its peers.

High quality assets trade at low valuations

Stock has got de-rated because of difference of opinion between minority investors and majority regarding allocation of capital

A very likable set of assets have been trading at low valuations because of difference of opinion between minority investors and the promoters on allocation of capital. Among the conflicts are:

1. The group has adopted a multi-layered structure to leverage control over large number of assets with lesser group cash outflow. Minority investors do not like this and attach a holding company discount.
2. On several occasions, the management has paid control premium while acquiring unrelated businesses. This results in leakage in value for minority shareholders.
3. Cash has been hoarded in certain group companies for prolonged periods yielding low post tax returns, while other group companies have been sitting with large debt and paying interest without corresponding tax offset. This has dragged RoE due to tax value leakage and low returns on cash pile. The surplus cash attracts valuation discount, as investors remain skeptical regarding capital allocation and difference between yield and cost of equity.
4. Equity has been diluted at times when companies were still holding cash piles.
5. Past restructuring had led to leakage of minority shareholder value, because the valuation methodology adopted was at variance with the way minority shareholders had been valuing assets.

High quality diversified assets

| | FY13 Production | Asset Positioning | Full capacity | Expansion plans/status |
|--------------------|--------------------------|--|----------------------------|---|
| Zinc India | 802kt Pb/Zn, 408t Silver | One of the lowest cost producer due to efficient operations and captive mine backing | 1.2mtpa Zn/Pb, 500t silver | HZL spending USD1.5b over next 6 years to increase mining capacity by 200ktpa |
| Zinc International | 426kt Pb/Zn | CoP in the lower half of the cost curve. Currently three mines operating namely Black Mountain, Lisheen and Skorpion | 400ktpa | Gamsberg mining project is at the initial level of development which could lead to further capacity expansion. |
| Oil and Gas | 205kboepd | Indian largest private sector crude oil producer with CoP in the lowest quartile of global cost curve | 240kboepd | |
| Iron ore (India) | 3.1mt | One of the largest private sector miner in India with CoP in the lowest quartile. | 17mt | Currently operations are suspended due to regulatory reasons. Karnataka mining is expected to restart in current year but with reduced capacity of 2.9mtpa (Earlier 6mtpa) |
| Iron ore (Liberia) | | Asset under development stage | 2mtpa | First shipment ore expected by March, 2014. Evacuation infrastructure is a major bottleneck. SSt plans to utilize road transport for the initial period. |
| Aluminium | 774kt | Conversion cost is low but lack of raw material backing undermines profitability | 2.3mtpa | 325ktpa Balco expansion to come onstream in 2014. VAL phase II expansion to increase capacity by 1.1mtpa but is currently stalled due to numerous issues. 1mtpa refinery is partially operational due to lack of bauxite. |
| Copper | 353kt | Low conversion cost, efficient operations | 800ktpa | Two units of 80MW CPP has recently being commissioned which will aid margins. Refinery expansion to 800ktpa capacity is at initial stage. |
| Power | 10.1b kwh | 1.98GW Talwandi Saboo on fixed ROE project, SEL 2.4GW has partial coal linkages therefore profitability is moderate. | 8.8GW | 1.98GW Talwandi Saboo to be progressively commissioned over FY14-15, 1.2GW Balco expansion awaiting Consent to operate. 2.4GW SEL project is operational but PLF is low due to evacuation issues. |

Source: Company, MOSL

We believe Sesa-Sterlite is an extraordinary company operationally, but financial management has been below average. Despite generating superior margins, the stock has been an underperformer. Sesa-Sterlite's assets have generated returns very quickly, but the capital generated has often been idle for many years. There are several instances, where assets generate lower returns but superior equity value for

There is an urgent need of fixing large slippage between RoIC and RoE for re-rating of stock - a more efficient capital structure is desired

shareholders because capital does not lie idle. One is better off generating average returns (say, 10.5% for 10 years) than generating high returns for brief periods (say, 15% for five years) and low returns for rest of the time (say, 6% for five years). Basically, there is a large slippage between RoIC and RoE. This issue needs to be fixed urgently for a meaningful stock re-rating.

Maintain Buy

The restructured SS will have EBITDA of INR282b in FY15, but attributed EBITDA will be INR201b after adjusting for minority holding in CAIR, HZ and Balco. Similarly, the attributed net debt will be higher at INR467b (after adjusting for minority interest in cash surplus HZ and CAIR) as compared to the pro forma net debt of INR269b. Assuming LME price of USD2,000/ton for aluminum, USD1,900/ton for zinc, and USD2,100/ton for lead in FY15, our SOTP-based valuation works out to INR214/share. Currently, the INR/USD rate is higher than our assumption of 60 for FY15. While a weaker INR results in ballooning of forex debt, there is greater gain in EBITDA for the oil and zinc-lead-silver businesses. We maintain **Buy**.

Stock performance (1 year)

Rising cost of production concerning, but multiple long-term positives

Margin outlook improving; upgrading to Buy

- Despite strategic advantages of location and captive bauxite mines, National Aluminium's (NACL) cost of production has continuously risen. Though its raw material cost is among the lowest, its labor cost at ~INR1.5m per man year is 2-3x other state-owned companies or peers. Its smelting capacity utilization has dropped to ~70% due to short-supply of coal linkages and delay in commencement of its captive Utkal-E coal block, increasing its fixed costs.
- A weaker INR could mean significant reduction in NACL's USD cost of production. Its alumina production is ramping up and the price outlook remains bullish due to steepening global cost curve. The resultant margin expansion and expected volume growth of 10% will drive up earnings. We estimate EPS at INR3.3 for FY15 (43% higher than FY13), assuming LME price at USD2,000/ton, exchange rate at INR60/USD and smelting capacity utilization at ~70%.
- NACL has a strong balance sheet, with cash surplus of INR42b-50b post capex. Potential upsides from the Utkal-E block, further expansion of the alumina refinery, weakening INR, and peaking of labor cost as older employees retire over the next 3-5 years are long-term positives. We upgrade our stock rating to Buy, with a revised target price of INR52.

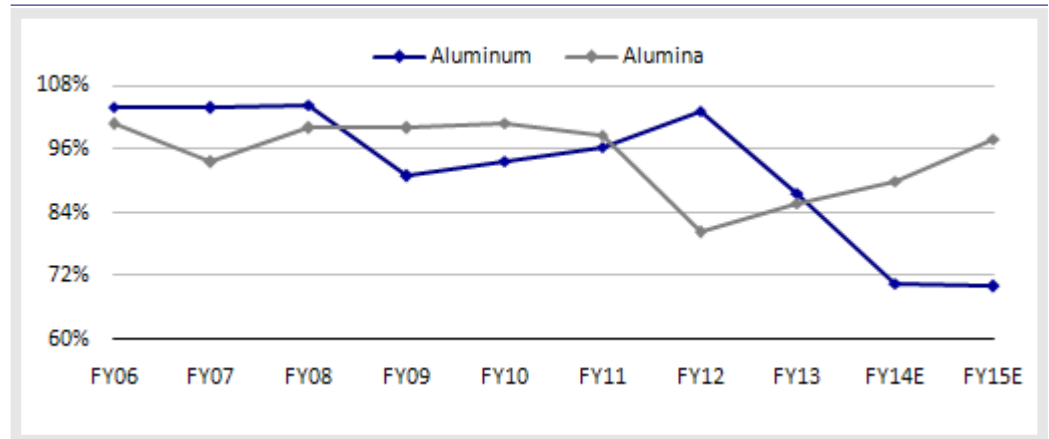

Aluminum - CoP rising, but INR depreciation to compensate

NACL's smelter and alumina refinery are ideally located. Its alumina refinery is located at Damanjodi, close to its captive Pottangi bauxite mines at Panchpatmali in Odisha. The smelter and its captive power plants are located in the Talcher coal belt in Odisha. Despite strategic advantages of location and captive bauxite mines, NACL's cost of production (CoP) has continuously risen. Though its raw material cost is low, its labor cost at ~INR1.5m per man year is 2-3x other state-owned companies or peers.

NACL has recently expanded its metal capacity from 345k tons to 460k tons, and alumina refinery from 1.6m tons to 2.3m tons. The alumina refinery is gradually ramping up to full capacity. However, its smelting capacity utilization has dropped to ~70% due to short-supply of coal linkages and delay in commencement of its captive Utkal-E coal block, increasing its fixed costs. Also, Coal India has raised prices multiple times in the last five years. Though its INR CoP has been rising, depreciation of the INR v/s the USD will result in its USD CoP being significantly lower.

Capacity utilization

Capacity utilization of smelter has fallen, but alumina is ramping up

Cost of production (USD/ton)

Although cost of production has increased, but it would be much lower in FY15M (MTM USD/INR rate of 62.5) vs FY15E (i.e. estimate of 60)

Source: Company, MOSL

Alumina - expect 10% volume growth; margins to expand

Nalco is likely to benefit from weaker USD/INR rate, stronger prices and ramping up of alumina production

A weaker INR could mean significant reduction in NACL's USD cost of production. Its alumina production is ramping up and the price outlook remains bullish due to steepening global cost curve. The resultant margin expansion and expected volume growth of 10% will drive up earnings. We estimate EPS at INR3.3 for FY15 (43% higher than FY13), assuming LME price at USD2,000/ton, exchange rate at INR60/USD and smelting capacity utilization at ~70%.

Production (k tons)

Source: Company, MOSL

A positive outlook for both alumina volumes & margin expansion and potential upsides from coal block calls for re-rating

Upgrading to Buy

NACL has a strong balance sheet, with cash surplus of INR42b-50b post capex. Potential upsides from the Utkal-E block, further expansion of the alumina refinery, weakening INR, and peaking of labor cost as older employees retire over the next 3-5 years are long-term positives. The stock trades at an attractive EV/EBITDA of 3x. In view of the changed business dynamics, we believe that NACL deserves an EV/EBITDA multiple of 5.5x. Topping this with the value of CWIP, our SOTP-based target price stands revised to INR52. We upgrade the stock to **Buy**.

Disclosures

This report is for personal information of the authorized recipient and does not constitute to be any investment, legal or taxation advice to you. This research report does not constitute an offer, invitation or inducement to invest in securities or other investments and Motilal Oswal Securities Limited (hereinafter referred as MOST) is not soliciting any action based upon it. This report is not for public distribution and has been furnished to you solely for your information and should not be reproduced or redistributed to any other person in any form.

Unauthorized disclosure, use, dissemination or copying (either whole or partial) of this information, is prohibited. The person accessing this information specifically agrees to exempt MOST or any of its affiliates or employees from, any and all responsibility/liability arising from such misuse and agrees not to hold MOST or any of its affiliates or employees responsible for any such misuse and further agrees to hold MOST or any of its affiliates or employees free and harmless from all losses, costs, damages, expenses that may be suffered by the person accessing this information due to any errors and delays.

The information contained herein is based on publicly available data or other sources believed to be reliable. While we would endeavour to update the information herein on reasonable basis, MOST and/or its affiliates are under no obligation to update the information. Also there may be regulatory, compliance, or other reasons that may prevent MOST and/or its affiliates from doing so. MOST or any of its affiliates or employees shall not be in any way responsible and liable for any loss or damage that may arise to any person from any inadvertent error in the information contained in this report. MOST or any of its affiliates or employees do not provide, at any time, any express or implied warranty of any kind, regarding any matter pertaining to this report, including without limitation the implied warranties of merchantability, fitness for a particular purpose, and non-infringement. The recipients of this report should rely on their own investigations.

This report is intended for distribution to institutional investors. Recipients who are not institutional investors should seek advice of their independent financial advisor prior to taking any investment decision based on this report or for any necessary explanation of its contents.

MOST and/or its affiliates and/or employees may have interests/positions, financial or otherwise in the securities mentioned in this report. To enhance transparency, MOST has incorporated a Disclosure of Interest Statement in this document. This should, however, not be treated as endorsement of the views expressed in the report.

Analyst Certification

The views expressed in this research report accurately reflect the personal views of the analyst(s) about the subject securities or issues, and no part of the compensation of the research analyst(s) was, is, or will be directly or indirectly related to the specific recommendations and views expressed by research analyst(s) in this report. The research analysts, strategists, or research associates principally responsible for preparation of MOST research receive compensation based upon various factors, including quality of research, investor client feedback, stock picking, competitive factors and firm revenues.

Regional Disclosures (outside India)

This report is not directed or intended for distribution to or use by any person or entity resident in a state, country or any jurisdiction, where such distribution, publication, availability or use would be contrary to law, regulation or which would subject MOST & its group companies to registration or licensing requirements within such jurisdictions.

For U.K.

This report is intended for distribution only to persons having professional experience in matters relating to investments as described in Article 19 of the Financial Services and Markets Act 2000 (Financial Promotion) Order 2005 (referred to as "investment professionals"). This document must not be acted on or relied on by persons who are not investment professionals. Any investment or investment activity to which this document relates is only available to investment professionals and will be engaged in only with such persons.

For U.S.

Motilal Oswal Securities Limited (MOSL) is not a registered broker - dealer under the U.S. Securities Exchange Act of 1934, as amended (the "1934 act") and under applicable state laws in the United States. In addition MOSL is not a registered investment adviser under the U.S. Investment Advisers Act of 1940, as amended (the "Advisers Act" and together with the 1934 Act, the "Acts"), and under applicable state laws in the United States. Accordingly, in the absence of specific exemption under the Acts, any brokerage and investment services provided by MOSL, including the products and services described herein are not available to or intended for U.S. persons.

This report is intended for distribution only to "Major Institutional Investors" as defined by Rule 15a-6(b)(4) of the Exchange Act and interpretations thereof by SEC (henceforth referred to as "major institutional investors"). This document must not be acted on or relied on by persons who are not major institutional investors. Any investment or investment activity to which this document relates is only available to major institutional investors and will be engaged in only with major institutional investors. In reliance on the exemption from registration provided by Rule 15a-6 of the U.S. Securities Exchange Act of 1934, as amended (the "Exchange Act") and interpretations thereof by the U.S. Securities and Exchange Commission ("SEC") in order to conduct business with Institutional Investors based in the U.S., MOSL has entered into a chaperoning agreement with a U.S. registered broker-dealer, Motilal Oswal Securities International Private Limited. ("MOSIPL"). Any business interaction pursuant to this report will have to be executed within the provisions of this chaperoning agreement.

The Research Analysts contributing to the report may not be registered /qualified as research analyst with FINRA. Such research analyst may not be associated persons of the U.S. registered broker-dealer, MOSIPL, and therefore, may not be subject to NASD rule 2711 and NYSE Rule 472 restrictions on communication with a subject company, public appearances and trading securities held by a research analyst account.
